GENERAL COVER LETTER

Dear Hiring Team,

I am applying for junior full-stack and backend development opportunities. I completed the Code Institute Full Stack Web Development diploma with Merit and have since focused on turning my technical skills into working, user-facing software.

My main project is AI Assistant, a SaaS platform that I built using Python, Django, PostgreSQL and modern API integrations. It includes AI-powered conversations, a knowledge base using retrieval-augmented generation (RAG), analytics, subscriptions through Stripe, a Discord integration and an embeddable website chatbot. I also developed a React Native / Expo Android app, which launched on Google Play in October 2026.

I work across backend logic, databases, integrations, frontend interfaces, testing and deployment. My other projects include Django web applications and JavaScript-based experiences. Building and operating a real product has strengthened my ability to investigate problems, prioritize reliable solutions and learn new technologies as needed.

Before moving into software development, I worked for many years in technical service roles. That background taught me to take responsibility, troubleshoot methodically, communicate clearly and deliver work that people can depend on.

I am particularly interested in remote-friendly teams where I can contribute with Python, Django, JavaScript and APIs while continuing to grow as a developer. I would welcome the opportunity to discuss how I could contribute to your team.

Kind regards,

Hussein Elali
